

Build a gold trading experience people trust.

Turn live market data into a polished buy - and - sell experience.

01 The brief

Build a deployable, single-user demo for buying and selling gold using live market data. A reviewer should be able to understand the starting balances, complete a trade, and see the updated balances without extra guidance.

Product state

Seed a PKR wallet, customer gold holdings, and platform inventory. Keep all three balances internally consistent after every trade.

Required trading flow

Show a live 24K rate in PKR per gram. Let the user enter PKR or gold, then issue a 75-second locked quote for review and confirmation. Finish with updated balances and a receipt.

Trust requirements

Show source and data freshness. Handle unavailable pricing, insufficient cash, gold or inventory, expired quotes, and repeated confirmation safely.

Out of scope

No authentication, real money movement, or admin panel. Mock or seed anything else needed to keep the reviewer focused on the trading experience.

Prioritize a coherent, finished feature set over gold plating (pun intended).

02 Pricing logic

Fetch pricing on the server no more than once every five minutes. Show the selected source and when it was last refreshed. Pause trading if neither source can be trusted.

03 Trade journey

The server owns the locked quote. If it expires, help the user get a new one. Never trade quietly at a different price.

04 Example stress cases

- 01 A source stops answering

Does the product still tell the truth?
- 02 A quote expires

Can the user continue without confusion?
- 03 A balance runs short

Cash, gold, and inventory all count.
- 04 Confirm is pressed twice

Does it still create only one trade?

These are examples, not the full list. Reviewers should be able to try them, including the guardrail, without changing your deployed code.

05 Evaluation

You will be evaluated on:

- 01 COMPLETION OF BRIEF
- 02 TECHNICAL JUDGMENT & SAFETY
- 03 CORRECTNESS & ATTENTION TO DETAIL
- 04 PRODUCT THINKING & VISUAL CRAFT

Visual direction

Calm, modern, and clearly financial without looking like a trading terminal. Use spacing and hierarchy before decoration. Treat mobile as a first-class surface. We recommend following Asasa's design system.

Curiosity helps; seek and you shall find.

06 Submission

Send us three links

Use any stack or coding tools.

EXPECTED EFFORT (WITH AI)

~3 hours

- 01 Public GitHub repository

Include setup instructions and a **WhatIDid.md** explaining how you understood the assignment, the assumptions you made, what you built, key decisions, and known gaps.
- 02 Public deployed product

It should open without reviewer credentials.
- 03 Build record

Share either your full Claude Code, Codex, or other coding-agent transcript, or a continuous screen recording of your coding session with the AI agent. Redact secrets, but leave useful dead ends in.
